The pitch now includes an entry decision

Comparison with public winning pitches | November 6, 2026

The screen remains a conditional LONG at $40 or below. The November 6 price of $56.28 does not meet that entry rule. New research quantifies the recurring cash needed to justify buying now and compares packaging margins with reported industry economics. The operating forecast is unchanged: $82.47 core target, or $73.56 at the higher discount rate.

Area	Useful pattern in examples	Revised Intel pitch
Business mechanism	Connect a specific driver to revenue and cash.	Market units x Intel unit share x ASP; then consolidated profit and investment.
Disagreement	Use a comparable dated expectation.	2028 sales $90.01B versus S&P $83.72B, a 7.5% difference.
Recommendation	Own a forecast and show what changes it.	Conditional LONG at $40 or below; $82.47 core 2030 target; no new position at $56.28.
Evidence	Research constrains the forecast.	Unit/mix bridge; customer alternatives; packaging margin controls; contrary workload results retained.
Cash	Make growth investment visible.	$124.5B near-term physical capex; tax, credits, minority cash and SBC counted once.
Failure tests	Tie risks to observable milestones.	Q4/H1 CPU, 2028 group profit/cash, 2030 factory recovery.

The comparison is a selected sample across different competitions, horizons and rules. It cannot estimate the probability of winning M37. The conditional entry is a completed investment judgment under chosen return requirements. Its competition appeal still depends on the reasoning; no published special-approval requirement was found.

What the examples teach

Borrow the reasoning, not their conclusions or numerical targets

WMS | UNC 2024 first place

The deck connects material conversion, mix and market access to a forecast above consensus. Intel now has a similarly explicit sales disagreement, but its public market forecast is not proprietary evidence. The reader can check each step. Official deck

JBI | Columbia 2023 first place

Its renovation-versus-construction distinction explains why a business might be misclassified. Intel's analogous distinction is that lost shipment share need not mean shrinking sales. This is an analytical interpretation of public data, not a claim every investor misunderstands it. Official deck

Cargojet | Waterloo 2024 global winner

Fleet utilization, routes and capital spending explain cash generation. Intel's counterpart is saleable factory output at a funded capital budget. The revised cash page makes the dependence visible rather than treating revenue as free cash. Official presentation

What remains weaker?

The pitch does not establish a compelling entry at $56.28 under my chosen return requirements. A 12% annual return requires an equivalent $3.20B additional recurring cash stream from 2031 at the core rate, or $7.79B at the higher rate. Research has not justified adopting that increase. The 12% requirement is my judgment, not an M37 rule; 9.6% is not inherently an inadequate return.

What should stay out of the main ten pages?

Long accounting explanations, the whole source ledger and every scenario combination. Put them in the workbook and defense notes. The main screen should remain about the three claims and the consequences if they fail.

What the research establishes

A completed decision can still depend on uncertain forecasts

The entry decision is made

Conditional LONG at $40 or below; no new position at the $56.28 reference quote. Core annual appreciation is 9.6%, or 6.7% at the higher discount rate. The chosen return requirements demand more compensation for execution risk. Research has not justified raising the forecast or adding omitted asset value. This is a decision, not a pending search for a higher target.

CPU growth and factory recovery remain forecasts

The model assumes $31.74B of 2027 CPU sales, $7B gross packaging sales and $2.50B of Foundry profit in 2030. Exact mix and customer economics are not observed. These assumptions have explicit stresses and monitoring thresholds. They are not facts that another research pass can make certain.

Calculations and asset treatment have been checked

Cash-flow and valuation reconciliations passed. Equity holdings, receivables, cash income and minority claims were reviewed; no justified extra asset value was established. R&D stays expensed, so the terminal metric is return on modeled net investment. A negative finding closes an investigation without increasing the target.

Financing has a defined evidence limit

Disclosed revolver capacity and maturities fit the illustrative draw. Amended pricing, fees and covenants were not located in reviewed filings. The 6%/8%/10% scenarios measure interest; future access is assumed and incremental fees are not modeled. That limits the funding claim without turning it into an endless research task.

Only one required package item is outstanding

The current resume is not yet included. The ten-page screen has Thomas Ou, Class of 2028 and a 2030 horizon. The official page requires neither an interview nor three supplements, and no special approval rule for an entry condition was found. The defense notes and comparison are preparation materials. Nothing has been submitted.

What would reopen the analysis?

Material earnings, customer terms, capital needs, a calculation error or a changed price and horizon. An interview reply could contribute evidence, but silence is not a blocker. A conditional long may be less compelling than a strong current-price opportunity; more sensitivity tables alone do not solve that competition weakness.
